## ***US Jetting 2040 – 600 Gallon, Kubota Diesel Powered Trailer Mounted High Pressure Jetting Unit***

The ***US Jetting 2040 - 600 Gallon Unit*** (2,000 PSI @ 40 GPM) is designed for flushing light and medium debris from pipelines. Higher water flow is more effective than higher pressurized water for removing light debris (such as silt & sand) normally found in storm sewers and drains.

A water cooled 83 horsepower Kubota Diesel powers the **US Jetting 2040** high pressure water pump. The Kubota engine is encased in a lockable protective covering to prevent vandalism.

Water is delivered to the nozzle through 500 feet of 3/4" high pressure jetting hose to the nozzle. All operator controls are centrally located next to the high pressure hose reel. The hose reel is mounted on a seven position swivel for added operator convenience. Twin 72 inch lockable toolboxes provide ample space for secure storage of nozzles and supplies.
